

manatee

Social cross-chain send. Tweet is UX. Attestcoin settles.

```
@ManateeWallet send 10 mtee @bob
```

Lock allowlisted ERC-20 on Ethereum Sepolia → Attestcoin verifies the event → mint on Creditcoin CC3. Recipient and token come from the attested log. CTC is gas only.

Live manatee-production.up.railway.app Repo github.com/ducnmm/manatee

The problem

1

Centralized bots

A social bot that “sends” can pick a different recipient or ticker after you tweet. You are trusting the operator.

2

Naive bridges

Many testnet bridges mint from an off-chain watcher. If the watcher lies, the destination chain still mints.

3

What we want

The tweet builds the lock. After Attestcoin verifies Sepolia, Creditcoin mints only to the event’s to and token.

How it works

1

Tweet

`@ManateeWallet send 1 mtee @AJEnglish`

2

Lock Sepolia

`ManateeLock.emit TokensSentForBridging(from, to, token, amount)`

3

Attest ~8–10 min

`usc-sdk` waits for height, then Merkle + continuity proofs

4

Mint CC3

`ManateeMint: receiptStatus, lock address, replay, mint event.to`

Trust model

Signal	Trusted for
Tweet / web (@bob, ticker mtee)	UX only. Builds the Sepolia lock the operator submits.
Event to, token, amount	Attested Sepolia TokensSentForBridging. Mint follows that.
Worker after lock	Submits proofs. Cannot pick recipient or asset at mint time.
Replay	processedQueries on the ASC.
Tx success	receiptStatus == 1 in ManateeMint (precompile does not).
CTC	Creditcoin gas. Not a sendable coin.

Live on testnet

Open these. Search @ajenglish on the app for the dashboard.

Sepolia lock

sepolia.etherscan.io/tx/0xf74e4375... TokensSentForBridging

Creditcoin mint

creditcoin-testnet.blockscout.com/tx/0xb6b3e7a5...

Recipient

[@AJEnglish](#) → [0x01a256e8...7DA6](#) · 2 mtee on CC3

App

manatee-production.up.railway.app

manatee

The social command never chooses recipient or asset.
Attestcoin does.
